LinkedIn Post Authors

Overview

The **LinkedIn Post Search & Scraping** feature in Blaze enables you to easily discover and save leads directly from LinkedIn posts based on your custom search criteria. This tool is perfect for identifying potential ambassadors, engaging with relevant communities, or building hyper-targeted segments from real-time conversations.

How to Use LinkedIn Post Search

1. Setup the Blaze Chrome Extension

Ensure your Blaze extension is installed and you're logged into your Blaze account.

 [Install the Blaze Chrome Extension ↗](#)

 **Important:** Only log into one Blaze account at a time when scraping LinkedIn leads. Logging into multiple accounts can cause data conflicts.

2. Create a LinkedIn Post Search Query

Head over to [LinkedIn Search ↗](#) and define your search query using relevant filters and keywords.

Example Queries:

- "Web3 Gaming" AND "Ambassador"
- #Airdrop AND "Early access"
- "Looking for beta testers" AND "crypto"

You can also filter by:

- Date posted (e.g., Past 24 hours, Past Week)
- Author (e.g., 1st/2nd/3rd-degree connections)
- Location or industry

3. Start Scraping with the Blaze Extension

Once your search query loads the LinkedIn post results:

- Click on the **Blaze extension** icon in your browser.
- Hit **"Start Scraping"**.
- The extension will begin extracting data from the visible LinkedIn posts and associated user profiles.

4. View and Use Your Scraped Posts

All scraped posts are automatically saved to your **Blaze account** under the **Social Reach** tab.

From there, you can:

- Filter by **Full Name**, **Headline**, **LinkedIn ID**, and **LinkedIn URL**
- Tag and categorize users
- Create a **Saved Segment** for easy access and follow-up
- Launch personalized outreach or campaigns directly from Blaze
