# LinkedIn Post Reactor/Commentor

## Overview

The **LinkedIn Post Engagement Scraping** feature in Blaze enables you to easily discover and save leads who have engaged with specific LinkedIn posts (through likes, reactions, or comments). This tool is perfect for identifying active community members, potential ambassadors, or high-intent users based on their real-time engagement with targeted content.

## 2. Copy the LinkedIn Post Page Link

Navigate to the specific LinkedIn post you want to scrape engagement data from.

- Click on the **timestamp** of the post (e.g., "2d", "1w", or an exact date).
- This will open the **LinkedIn post page**.
- Copy the **URL** from your browser address bar.

## 3. Start Scraping with the Blaze Extension

Once you're on the LinkedIn post page:

- Click on the **Blaze extension** icon in your browser.
- Hit **"Start Scraping"**.
- The extension will extract the list of **reactors (likers, clappers, etc.)** and **commenters** from the post.

## 4. View and Use Your Scraped Engagement Data

All scraped profiles are automatically saved to your Blaze account under the **Social Reach** tab.

From there, you can:

- Filter by **Full Name**, **Headline**, **LinkedIn ID**, and **LinkedIn URL**
- Tag and categorize users
- Create a **Saved Segment** for easy access and personalized follow-up
- Launch outreach campaigns to engage high-intent community members
